

Self-installable Environmental Control Kit

BJ-B15

Control your main devices from the computer

This kit consisting of **three products** allows you to control your TV, multimedia equipment, electrical appliances and generate an alert for your family, all from your computer.

Thanks to the **Control USB** controller, which includes a customizable environment control application, it is possible to control any item in your house that already has a remote control, from your PC. The kit is complemented with a receiver (**Enabler Socket+**) that switches any electrical appliance on or off and with an alarm receiver (**Enabler Alarm**) that allows you to notify a family member anywhere in the house when help is required.

The solution is easily programmed for each individual and there is no need for a technician to carry it out.

The kit is compatible with any computer access system including any type of mouse (head, chin...) control with eyes or operation from other programmes like The Grid.

The kit is based on the following elements:

- 1x USB Control
- 1x Enabler Socket+
- 1x Enabler Alarm

The USB Control, which must be connected to the PC, incorporates pre-defined control software and easily customizable templates. The configuration allows you to control the different devices in your home and can copy the function of the infrared remote controls in the home (TV, stereo, etc.).

In turn, Enabler Socket+ allows you to activate/deactivate any electrical device (lamp, heater, fan...) from the computer.

The third element is the Enabler Alarm which is designed to alert your carers and/or family and you can activate it from the computer thanks to the USB Control via a radiofrequency signal.

Both the Enabler Socket+ and the Enabler Alarm can be in a different room to the computer, thanks to its radiofrequency technology.
