UV sensory gel tiles

BJ-SSUV

An interactive tile set that responds to movement and ultraviolet light, creating dynamic visual effects.

This sensory floor is an effective solution to stimulate the senses, encourage movement, and promote exploration in educational and therapeutic environments.

Transform any space into a visual and sensory experience

Each tile contains liquid and decorative elements that move and respond to pressure.

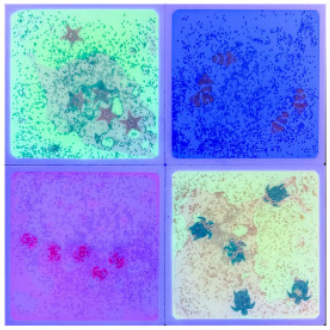
When users interact with the tiles, the internal elements —such as simulated fish— shift and flow, creating a captivating visual effect that invites movement and exploration. This type of stimulation encourages curiosity, attention, and active participation, especially in children.

A sensory experience under UV light

Under ultraviolet lighting, the tiles reveal their full potential. Reactive materials create glowing and reflective effects that enhance the visual experience, making them especially engaging in multisensory rooms or Snoezelen environments.

Safe and easy to use

Made from durable, non-toxic materials with a non-slip base, these tiles are designed for safe use even in intensive environments. They require no installation, allowing them to be placed and removed easily as needed.

At Qinera, we believe in solutions that invite people to feel, explore, and participate. This sensory floor is a simple yet powerful way to enrich any environment.


- Tile size: 50 × 50 cm
- Format: pack of 4 tiles
- No installation required. Easy to place and remove
- Tiles with internal moving liquid
- Includes decorative elements (such as simulated fish)
- UV-reactive material, creating luminous and reflective effects
- Made of durable thermoplastic
- Non-toxic materials
- Non-slip base for enhanced safety
